QUESTIONS & ANSWERS DEMO VERSION (LIMITED CONTENT)

Version: 19.3

Question: 1	
Which event is user interaction?	
A. gaining root access B. executing remote code C. reading and writing file permission D. opening a malicious file	
	Answer: D
Explanation: User interaction is any event that requires the user to perform an action cyberattack. Opening a malicious file is an example of user interaction, as malicious code or malware that can compromise the system or network. remote code, and reading and writing file permissions are not user interaction be performed by an attacker after exploiting a vulnerability or bypass controls. Reference: Understanding Cisco Cybersecurity Operations Fund Cisco , More than 99% of cyberattacks rely on human interaction	s it can trigger the execution of Gaining root access, executing actions, but rather actions that sing security
Question: 2	
Which security principle requires more than one person is required to pe	erform a critical task?
A. least privilege B. need to know C. separation of duties D. due diligence	
	Answer: C

Explanation:

Separation of duties is a security principle that requires more than one person to perform a critical task, such as authorizing a transaction, approving a budget, or granting access to sensitive data. Separation of duties reduces the risk of fraud, error, abuse, or conflict of interest by preventing any single person from

Answer: C

principles, but they do not require more than one person to perform a critical
task. Reference: <u>Separation of Duty (SOD) - Glossary CSRC - NIST Computer Security, Separation of Duties Imperva</u>
<u>Duties Imperva</u>
Question: 3
How is attacking a vulnerability categorized?
A. action on objectives
B. delivery
C. exploitation
D. installation
Answer: C
Explanation:
Annual Control of the
Attacking a vulnerability is categorized as exploitation, which is the third phase of the cyberattack
lifecycle. Exploitation is the process of taking advantage of a vulnerability in a system, application, or
lifecycle. Exploitation is the process of taking advantage of a vulnerability in a system, application, or network to gain access, escalate privileges, or execute commands. Action on objectives, delivery, and

Explanation:

C. It collects and detects all traffic locally

D. It manages numerous devices simultaneously

Agent-based protection is a type of endpoint security that uses software agents installed on the devices to monitor and protect them. Agent-based protection can collect and detect all traffic locally, which

means it can operate without relying on a network connection or a centralized server. Agent-based protection can also provide more granular and comprehensive visibility and control over the devices. Which principle is being followed when an analyst gathers information relevant to a security incident to determine the appropriate course of action?

- A. decision making
- B. rapid response
- C. data mining
- D. due diligence

Answer: A

Explanation:

Decision making is a principle that guides an analyst to gather information relevant to a security incident to determine the appropriate course of action. Decision making involves identifying the problem, defining the criteria, analyzing the alternatives, and choosing the best solution. Decision making helps an analyst to respond to an incident effectively and efficiently, while minimizing the impact and risk to the organization.
