Question: 1

What NetApp data protection solution ensures that data cannot be accessed if a disk shelf is stolen?

- A. snapshot volume
- B. IPsec
- C. disk encryption
- D. SnapLock volume

Answer: B

Explanation:

Disk encryption (such as NetApp Storage Encryption or NetApp Volume Encryption) ensures that data stored on disks is inaccessible if a disk or disk shelf is stolen, because the data is encrypted at rest and requires keys that are not stored on the hardware itself.

Question: 2

Which two NetApp data security solutions can be licensed to help protect against ransomware attacks? (Choose two.)

- A. Spot Security

- B. Cloud Insights
- C. BlueXP tiering
- D. ONTAP One

Answer: A, D

Explanation:

Spot Security uses machine learning to detect anomalies and threats, including potential ransomware activity, and helps enforce zero-trust security policies.

ONTAP One includes comprehensive security features such as Autonomous Ransomware Protection (ARP), multi-admin verification, SnapLock, and more to defend against ransomware attacks.

Question: 3

What ensures that data is continuously secure and encrypted in-flight?

- A. NetApp Volume Encryption (NVE)
- B. NetApp Aggregate Encryption (NAE)
- C. Transport Layer Security (TLS)
- D. Onboard Key Manager (OKM)

Answer: C

Explanation:

TLS (Transport Layer Security) ensures that data is encrypted in-flight, meaning during transmission between systems. It protects data against eavesdropping and tampering as it moves over the network.

Question: 4

<https://www.examsnest.com>

As the administrator of a NetApp cluster with multi-admin approval enabled for volume deletes, you have been tasked with deleting a volume. No other administrator is available to approve this request.

What do you need to do to disable multi-admin approval?

- A. Multi-admin approval cannot be disabled
- B. Open a NetApp support case
- C. Use volume delete -force true command
- D. Click the Enabled toggle button in ONTAP System Manager

Answer: B

Explanation:

When multi-admin approval (MAA) is enabled in ONTAP, it cannot be disabled by a single administrator through standard commands or GUI actions to maintain security integrity. To disable MAA without the required approvals, you must open a NetApp support case to request assistance.

Question: 5

When backing up on-premises NetApp ONTAP volumes to tape using NDMP, which two engines are supported by ONTAP software? (Choose two.)

- A. tar
- B. SMTape
- C. cpio
- D. dump

Answer: B. D

Explanation:

When using NDMP (Network Data Management Protocol) to back up ONTAP volumes to tape, ONTAP supports two backup engines:

- SMTape: Used for block-level backups.
- dump: Used for file-level backups.

These are the only engines supported by ONTAP for NDMP-based tape backups.
